## ADCA100

## ADC Adapter with 24 BNC Connectors for Voltage Output or Current Supplied Sensors

## FEATURES

- Multi channel analog interface SyMBus24 to AD Card Disturbance tolerant symmetrical transmission MDR68 front connector for reliable repetitive plugging
- 24 channel analog interface 24BNC to sensors

24 widely accepted BNC front connectors

- $\pm 10 \mathrm{~V}$ input-voltage range (current sources off)
- 2 V to 22 V with current sources switched on $10 \mathrm{k} \Omega$ input resistance
- 2 Hz to 80 kHz frequency response (with ADC100MLN card)
$4 \times$ switchable $6 \times 3 \mathrm{~mA}$ center contact current supply
- Nonvolatile calibration and configuration memory
- Onboard voltage monitoring
- Green activity LED
- Low power consumption (5 W typically)
- Aluminum box can be placed underneath the mcdRec721x and locks its feet

The ADCA100 is an aluminum adapter box that has been developed for connecting the symmetrical ADC1xxMLN Analog Measurement Cards to up to 24 single-ended voltage output or the common 2 - 20 mA current supplied sensors better known by their registered trademarks ICP®, DeltaTron ${ }^{\circledR}$, Isotron ${ }^{\circledR}$ and Piezotron ${ }^{\circledR}$.

It holds 24 (two rows of 12) BNC connectors and has four switches on the backside each switching 6 of the 24 AC inputs between $\pm 10 \mathrm{~V}$ and 2 V to 22 V input-voltage with 3 mA sensor supply.

Configuration and results of the factory-calibration can be stored in a nonvolatile memory and used for compensation while measuring.

Disturbance tolerant transmission from the MDR68 connector to the Analog Measurement Card is achieved when using the symmetrical mccabAR1xx cable.

## TECHNICAL DATA

## ADCA100

## THEORY OF OPERATION

Signals entering the ADCA100 are passing ESD-protections and line inductors where high-frequency-components are removed that the following amplifiers cannot damp sufficiently.

Each of four switches can connect a group of six inputs to low noise 3 mA current regulators operating from a filtered 6 V to 24 V step up voltage converter.

Symmetrical-output-amplifiers are used to level from single-ended 7 Veff input- to differential 1.4 Veff output-voltagerange allowing for disturbance tolerant connection to ADC10xMLN or the low power ADC11xMLN Analog Measurement Cards by connecting the MDR68 connectors with a symmetrical mccabAR1xx cable.

Capacitors set the lower end of the frequency range to 1.6 Hz and the upper end to 150 kHz resulting in a 2 Hz to 80 kHz frequency range together with an ADC100MLN card at 192 kHz sampling frequency.
/DETECT connects to 0 V to inform the measurement card that a device is present.

A microcontroller communicates with the AD card via optically decoupled IS_SERIAL_IN and IS_SERIAL_OUT and provides for reading and writing of the nonvolatile configuration and calibration memory as well as for monitoring the three supply-voltages.

A green front-panel-LED is connected to a 12 mA current source and can be switched on and off from the ADC1xxMLN using SWITCH_0 V.
/SHUTTER is prepared for future use.
